*Measured under 3σ confidence level (99.7%) at 0.67 Sd, constant temperature and constant voltage supply. **Static resolution is measured filtering the signal at 20 Hz. Dynamic resolution is measured filtering the signal at 1 kHz. ***Over time a temperature drift of up to 10% can occur on the sensor, so regular calibration is recommended, depending on the application.

CORRECTION FACTORS									
Steel FE 360	1	Copper	0.34	Aluminum	0.38	Brass	0.48	Stainless S. V2A 1 / 2 mm	0.74

Note: the operating distance of the sensor must be multiplied by the correction factor of the material. For example, the operating distance on Aluminum is $S_{n,AI} = S_n \times CF_{AI}$. In case of embeddable mounting, the distance is multiplied by the additional correction factor of the support, thus $S_{n,AI} = S_n \times CF_{AI} \times CF_{emb,AI}$.
